

Thin Absorbent Skin Adhesive (TASA™)

Thin Absorbent Wound Dressing, featuring TASA™

The future of wound care is clear.

Thin Absorbent Skin Adhesive™ (TASA™) is a new technology combining absorbency with transparency and thinness. When in contact with moisture, TASA remains clear and intact. TASA technology is combined with a smooth, low-friction polyurethane top film. The resulting product allows for complete site visualization providing greater confidence in the progression of the wound healing. As a thin and flexible material, it can easily conform to body contours, even in hard to dress locations.

Clinical Evaluation

TASA was the subject of a fifteen-patient clinical evaluation conducted at the Worcester Health and Care Trust (Worcester, UK).

TASA™ Thin Absorbent Skin Adhesive™ Dressing

Gentle and Easy to Use

TASA's unique design translated into appreciable clinical benefits. Scoring each attribute on a five-point scale, the clinicians' average impressions of TASA™ were as follows:

Private Label

These private label products have been researched and developed by our Global development team and can easily be added to your Wound Care product portfolio, with your branding and labeling. This decreases time to market, as you do not need to go through a costly product development process. We manufacture the product on your behalf and supply a labeling template that can simply be updated with your branding.

Indications

The TASA™ Thin Absorbent Wound Dressing is indicated for management of lightly to moderately exuding wounds, including but not limited to pressure ulcers, partial thickness wounds, minor wounds, protection of clean surgical incisions, skin graft donor sites, superficial skin wounds and as a secondary dressing on full thickness wounds.

Advantages

- **Exceptionally transparent** — Get a better look at the healing process. TASA™ remains clear even as it absorbs fluid.
- **Ultra thin** — Conformable like a film dressing, with additional absorptive capacity, TASA™ gives you both. At just 0.12 mm thin, TASA is less than half the thickness of thin hydrocolloids.
- **Surprisingly absorbent** — TASA™ offers greater fluid handling capacity than competitive thin dressings, relative to its thickness.
- **Enhanced comfort** — Conformable, comfortable and atraumatic, improving the patient's experience.
- **Fewer dressing changes** — With better absorption and transparency you can keep a single dressing in place longer.
